Classic Minesweeper, where the first click is 0...8. When comparing whether best front cell or nonclicked unseen cell (n.u.) should be guessed, it uses the min n mines in front, that is, the 'worst case scenario' regarding nonclicked unseen cells. This essentially favours guessing into front more than in n.u. cells														
test #	games	won	lost	% won	average time per game (s)	total time (min)	situations solved by mine-count	minecount solutions / game	guesses	guesses / game	games won without guessing	games won w/o guessing, %	longest game (min)	dropbox

Same as above, except guessing prob comparer uses BEST case uu_cell safe probabilities instead of WORST probs. This is a test.
